

Title: Blocking Semiovals and their Applications in Cryptography  
Speaker: Keith E. Mellinger  
Affiliation: University of Mary Washington

We discuss a cryptographic protocol discovered about 15 years ago that uses ideas from design theory. The technique relies on a key for the cipher system called a "determining set." In the optimal case, determining sets are blocking semiovals which have been studied by finite geometers. This talk will focus on an understanding of the cryptographic application along with the relevant ideas from finite geometry.
