

Title: *On the complexity of computation trees which decide membership in subsets of fields of characteristic p .*

Speaker: Paul Hriljac

Affiliation: ERAU-Prescott (Professor Emeritus)

Abstract: This talk will discuss computation trees which decide membership for finite subsets of algebraically closed fields of positive characteristic. We show how to construct a moduli space for such sets. We then define the complexity of a computation tree and show that for a generic subset of the field the complexity of any tree that decides membership for that subset must have a large complexity.
